# Model VM2.0PAFF

Programmable Amplifiers  
with Fixed Frequency Filters  
>100 kHz to 2.0 MHz VME Board

## 32 Channel

### Description

Frequency Devices' Model VM2.0PAFF comprises a family of VMEbus amplifier/filter boards offering software programmable differential amplifiers combined with precision 4-pole Butterworth or Bessel linear analog filters in a single width B-size (6U) VME form factor. VM2.0PAFF boards provide simultaneous access to 32, DC-coupled wideband signals while providing programmable gain from -12dB to +36dB in 6dB steps and fixed frequency filters with corner frequencies from >100 kHz to 2.0 MHz. VM2.0PAFF boards may be configured with 8, 16, or 32 channels. The boards conform to VME revision C.1 as an A16/D16 Slave. Available options include AC-coupled input.

### Features/Benefits:

- Simultaneous access over 32 channels offers a low cost, versatile and convenient way to provide amplification and filtering.
- Three active read/write registers provide programming and set-up verification.
- Phase match of  $\pm 2.0^\circ$  and gain accuracy of  $\pm 0.1\text{dB}$  provides precision performance solutions to design engineers, system integrators and OEM's.
- Four pole Butterworth or Bessel transfer functions with broad range of corner frequencies to meet a wide range of applications
- High channel count density without sacrificing performance maximizes chassis utilization.

### Signal conditioning applications include:

- Sonar, navigation and aerospace
- Engine test and simulation
- Acoustic and vibration analysis
- Satellite and telecommunications
- Laboratory R & D
- Automatic test equipment (ATE)
- Industrial process control
